

altek modular system

Since the very beginning altek is using the modular assembly system for its valves and regulators. This assures that all components in our regulator and valve system can be combined with each other. Thereby the main advantage of this system is its flexibility and adaptability to different individual requirements of our customers. Which product line a distinct component belongs to directly refers to its designation. For instance, a “mechanical shut off valve 36/AS24” belongs to the 24mm product line, whereupon the number after the slash is referring to altek’s plug-in system.
